Elicitation Report

Purpose: to define your problem in terms of real users and real problems, as opposed to assumptions or guesswork.

What to submit:

1. A list of the people you interviewed and their relevant attributes
    a. Note that this is best submitted as a table, with a row for each person and a column for each category relevant to your interviews (ex. year in school, major, etc.)
    b. I would expect anywhere from 5-10 interviews for this phase. Your table should highlight the diversity among your interviewed sample, showing that you included insights from an appropriately varied group of students.
    c. Please include the notes you took in each of these conversations as an appendix to this assignment. (I'm not worried about formatting for these notes, so feel free to just include the notes that you took in order to reference back and answer the remaining questions)
2. The key things you heard in your interviews
    a. Generic findings ("students want things to be faster") tell us the interviews didn't teach you much
    b. Specific, surprising findings ("three of the five students we talked to didn't know this service existed at all") tell us you actually listened
3. How it shaped your solution
    a. This is potentially the most important part. What did you change based on what you heard? If your problem definition or solution looks exactly like what you would have designed before talking to anyone, the interviews were just for show.
    b. Show us where real life examples or insights changed your mind (e.g. the assumption you dropped, the population you re-targeted, the feature you cut or added because a real person told you something).
